

Project Proposal

Project Title

Event Management System

Problem Statement

A growing number of organizations and individuals arrange events such as seminars, workshops, weddings, conferences, and social gatherings. Managing these events manually causes issues such as poor record keeping, scheduling conflicts, difficulty in managing registrations, and lack of proper coordination between organizers and participants. There is a need for a simple and efficient software solution that can manage event-related activities in a structured and reliable manner.

Solution

Our team has decided to develop a **Java-based Event Management System** with a graphical user interface. This software solution aims to streamline the process of creating, managing, and organizing events while maintaining proper records of users, events, and registrations. The system focuses on usability, clarity, and proper documentation using software engineering principles such as UML and class diagrams.

The proposed system will be suitable for academic use and small-scale event management, emphasizing documentation and design rather than complex backend implementation.

Brief Description of Modules

Event Management

- Create and manage events
- Store event details such as event name, date, time, venue, and description
- Update or delete event information

User Management

- Manage user login and roles (Admin, Organizer, Attendee)
- Store basic user information (name, email, role)

Registration Management

- Allow users to register for events
- Maintain a list of registered participants for each event
- View registration status

Admin Management

- Manage users and events
- Monitor overall system activities
- Generate basic reports (number of events, registrations)

Daily-Basis Activity

- View daily created events
- View number of registrations per day
- Track basic system usage information

Software Architecture

Application Type: Desktop Application

Architecture: Multi-user (Conceptual)

Technology: Java GUI (Swing)

Team Members:

Name	RollNo
Shanza Shafiq	BITF24M008
Aswah Rani	BITF24M016
Tehreem Fatima	BITF24M029
Zarmeennaz	BITF24M056

Conclusion

The Event Management System project provides a practical approach to understanding software engineering concepts such as problem analysis, system design, UML modeling, and documentation.
